

IN THE UNITED STATES PATENT AND TRADEMARK OFFICE

Applicant : Ming Ji et al.

Serial No : Not Yet Assigned (National Stage of PCT/JP2004/017602)

I.A. Filed : November 26, 2004

For : STREAMING SYSTEM

**PRELIMINARY AMENDMENT**

Commissioner of Patents  
U.S. Patent and Trademark Office  
Customer Service Window, Mail Stop \_\_\_\_\_  
Randolph Building  
401 Dulany Street  
Alexandria, VA 22314

Sir:

Prior to the examination of the above-identified patent application on the merits, the Examiner is respectfully requested to amend the claims as follows:

**Amendments to the Claims** are reflected in the listing of claims which begins on page 2 of this paper.

**Amendments to the Claims:**

This listing of claims will replace all prior versions, and listings, of claims in the application:

**Listing of Claims:**

1. (Original) A streaming system comprising a server which transmits a media stream having a layer structure including at least a session layer through a network and a client which receives the media stream from the server through the network, the server comprising:

a storing unit operable to store management information for managing the media stream in a session description protocol of the session layer of the media stream; and

a transmitting unit operable to transmit the session description protocol in which the management information is stored to the client in the session layer of the media stream, and

the client comprising:

a receiving unit operable to receive the session description protocol in which the management information is stored from the server;

an extracting unit operable to extract the management information from the received session description protocol; and

a managing unit operable to manage the media stream on the basis of the extracted management information.

2. (Original) The streaming system according to claim 1, wherein

the management information is an IPMP tool list or an IPMP descriptor related to an IPMP tool used in the protection of the media stream, and

the managing unit specifies the IPMP tool by the extracted IPMP tool list or the IPMP descriptor to manage the media stream.

3. (Original) The streaming system according to claim 1, wherein the management information is right information of the media stream.

4. (Currently Amended) The streaming system according to claim 1 ~~any one of claims 1 to 3~~, wherein

the management information is stored in a session level attribute related to all media streams in the same session of the session description protocol.

5. (Currently Amended) The streaming system according to claim 1 ~~any one of claims 1 to 3~~, wherein

the management information is stored in a media level attribute related to associated media streams in the session description protocol.

6. (Original) A server which transmits a media stream having a layer structure including at least a session layer to a client through a network, comprising:

a storing unit operable to store management information for managing the media stream in a session description protocol of the session layer of the media stream; and

a transmitting unit operable to transmit the session description protocol in which the management information is stored to the client in the session layer of the media stream.

7. (Original) The server according to claim 6, wherein

the management information is an IPMP tool list or an IPMP descriptor related to an IPMP tool used in protection of the media stream.

8. (Original) The server according to claim 6, wherein

the management information is right information of the media stream.

9. (Currently Amended) The server according to claim 6 ~~any one of claims 6 to 8~~, wherein

the management information is stored in a session level attribute related to all media streams in the same session of the session description protocol.

10. (Currently Amended) The server according to claim 6 ~~any one of~~  
~~claims 6 to 8~~, wherein

the management information is stored in a media level attribute  
related to associated media streams in the session description protocol.

11. (Original) A client which receives a media stream having a layer  
structure including at least a session layer from a server through a network,  
comprising:

a receiving unit operable to receive a session description protocol in  
which management information for managing the media stream is stored  
from the server;

an extracting unit operable to extract the management information  
from the received session description protocol; and

a managing unit operable to manage the media stream on the basis  
of the extracted management information.

12. (Original) The client according to claim 11, wherein

the management information is an IPMP tool list or an IPMP  
descriptor related to an IPMP tool used in protection of the media stream,  
and

the managing unit specifies an IPMP tool used in protection of the  
media stream by the extracted IPMP tool list or the IPMP descriptor to  
manage the media stream.

13. (Original) The client according to claim 11, wherein

the management information is right information of the media stream.

14. (Currently Amended) The client according to claim 11 ~~any one of claims 11 to 13~~, wherein

the management information is stored in a session level attribute related to all media streams in the same session of the session description protocol.

15. (Currently Amended) The client according to claim 11 ~~any one of claims 11 to 13~~, wherein

the management information is stored in a media level attribute related to associated media streams in the session description protocol.

16. (Original) A transmitting method which transmits a media stream having a layer structure including at least session layer to a client through a network, comprising:

storing management information for managing the media stream in a session description protocol of the session layer of the media stream; and

transmitting the session description protocol in which the management information is stored to the client in the session layer of the media stream.

17. (Original) The transmitting method according to claim 16, wherein  
the management information is an IPMP tool list or an IPMP  
descriptor related to an IPMP tool used in protection of the media stream.

18. (Original) The transmitting method according to claim 16, wherein  
the management information is right information of the media stream.

19. (Currently Amended) The transmitting method according to claim 16  
~~any one of claims 16 to 18~~, wherein

the management information is stored in a session level attribute  
related to all media streams in the same session of the session description  
protocol.

20. (Currently Amended) The transmitting method according to claim 16  
~~any one of claims 16 to 18~~, wherein

the management information is stored in a media level attribute  
related to associated media streams in the session description protocol.

21. (Currently Amended) A transmitting program which is designed such  
that the transmitting method according to claim 16 ~~any one of claims 16 to~~  
~~20~~ can be executed by a computer.

22. (Original) A computer readable recording medium in which the transmitting program according to claim 21 is stored.

23. (Original) A receiving method which receives a media stream having a layer structure including at least session layer from a server through a network, comprising:

receiving a session description protocol in which management information for managing the media stream is stored from the server;

extracting the management information from the received session description protocol; and

managing the media stream on the basis of the extracted management information.

24. (Original) The receiving method according to claim 23, wherein

the management information is an IPMP tool list or an IPMP descriptor related to an IPMP tool of the media stream, and

in the course of the step of managing the media stream of the client, specifying an IPMP tool used in the protection of the media stream by the extracted IPMP tool list or the IPMP descriptor to manage the media stream.

25. (Original) The receiving method according to claim 23, wherein

the management information is right information of the media stream.

26. (Currently Amended) The receiving method according to claim 23 ~~any one of claims 23 to 25~~, wherein

the management information is stored in a session level attribute related to all media streams in the same session of the session description protocol.

27. (Currently Amended) The receiving method according to claim 23 ~~any one of claims 23 to 25~~, wherein

the management information is stored in a media level attribute related to associated media streams in the session description protocol.

28. (Currently Amended) The receiving program which is designed such that the receiving method according to claim 23 ~~any one of claims 23 to 27~~ can be executed by a computer.

29. (Original) A computer readable recording medium in which the receiving program according to claim 28 is stored.

30. (Original) A media stream transmitted and received from a server to a client through a network and having a layer structure including at least a session layer, wherein

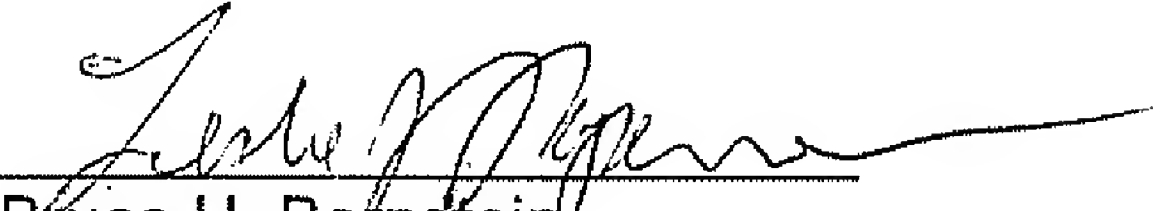

management information for managing the media stream is stored in a session description protocol of the session layer.

REMARKS

By the above amendment, claims 4, 5, 9, 10, 14, 15, 19, 20, 21, 26, 27 and 28 have been amended to delete multiple claim dependency, and no estoppel should be deemed to be associated with this amendment.

If there should be any questions, the Examiner is invited to contact the undersigned at the telephone number listed below.

Respectfully submitted,
